

DriveOps Vehicle Forensic & Accident Report

Analyzed File: sample_raw_input.csv | Generated: August 29, 2026 • 01:01 AM

PRIMARY CAUSE: NORMAL / SAFE DRIVING

**SEVERITY: LOW |
BEHAVIOR: NORMAL**

Forensic Diagnosis: yaw and lateral motion suggest a sharp turn or skid; strongest signals: peak yaw rate, sustained yaw; smoothed to normal_driving because the signal was not sustained

Key Telemetry & Forensic Metrics

Telemetry Metric	Peak / Observed Value	Telemetry Metric	Peak / Observed Value
Maximum Speed	39.0 km/h	Peak G-Force (Acc)	1.53 g
Average Speed	26.2 km/h	Peak Jerk (Rate of Acc)	0.51 g/s
Maximum Speed Drop	6.3 km/h	Peak Yaw (Lateral Turn)	1.003 rad/s
Peak Brake Input	88.0%	Peak Throttle Input	80.0%

Sensor Telemetry & Motion Waveforms

Time-series tracking of vehicle velocity profile and resultant G-force acceleration magnitude.

Control Inputs & Angular Dynamics

Driver pedal engagement (Throttle % / Brake %) and lateral yaw rotation rate.

ML Model Incident & Behavior Distributions

Driving Behavior

Accident Cause Breakdown

Forensic Window-by-Window Log

Detailed classification and signal contribution for the first 1 sliding analysis windows.

Window	Behavior	Predicted Cause	Confidence	Forensic Reasoning / Strongest Signals
0	NORMAL	Normal Driving	0.36	yaw and lateral motion suggest a sharp turn or skid; strongest signals: peak yaw rate, sustained yaw; smoothed to normal_driving because the signal was not sustained
